## 1 Introduction

The Lua program `runtexfile` parses an (L)TeX-document for lines starting with `%! HV`. The «HV» has no meaning, it should only be a significant marker for the command lines. Such lines can define commands which will be executed by `runtexfile`. These lines must be at the beginning of the document. Only empty lines before will be ignored. `runtexfile` will stop parsing for commands if a line without a preceding `%! HV` is found. If there is no such line, it runs by default `lualatex`.

### 1.1 Syntax

The syntax is `runtexfile [...] <file>` where [...] are optional arguments, either in short or long form which, of course, can be mixed:

```
runtexfile [-h,--help] [-v,--verbose] [-V,--version ] filename
```

Every executed command gets an own logfile `runtexfile-?.log` in which the question mark is the number of the corresponding command line in the document. This allows to locate any problem in the several external runs. With the option `-v` (verbose) a short logfile which lists more or less only the important steps from within the script is `runtexfile.log`.

All L<sup>A</sup>T<sub>E</sub>X commands are startet with the option

```
--interaction=nonstopmode
```

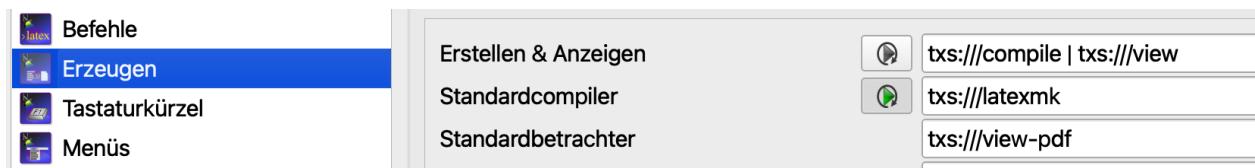

The supported (L)TeX-commands are

```
local commands = {"lualatex", "luatex", "luahbtex", "latex", "pdflatex",
                  "xelatex", "xetex" }
```

This is not really of interest, because it is only needed for the decision to use the option `--interaction=nonstopmode` or not. It is only valid for any run depending to a (L)TeX-program. The optional filename `<file>` must always be used if the current command expects another filename (see example for multiple index files).

### 1.2 T<sub>E</sub>Xstudio

For T<sub>E</sub>Xstudio use as default compiler `latexmk` and simply replace the name by `runtexfile` (see last line in the second image):

 Befehle	
 Erzeugen	open %.pdf > /dev/null
 Tastaturkürzel	dviPs
 Menüs	DviPng
 Symbolleisten	Ps2Pdf
 GUI-Skalierung	DviPdf
 Editor	BibTeX
 Erweiterter Editor	BibTeX 8-Bit
 Syntaxhervorhebung	Biber
 Vervollständigung	Makeindex
 Sprache prüfen	Texindy
 Vorschau	Xindex
 Interner PDF-Betrachter	Makeglossaries
 SVN/GIT	MetaPost
	Asymptote
	Ghostscript
	Latexmk

## 2 examples

### 2.1 This document

The header looks like

Command lines for this document

```
%! HV lualatex
%! HV biber
%! HV xindex
%! HV lualatex
%! HV lualatex

%% .11462025 07 1907 38 43
%
\listfiles\setcounter{errorcontextlines}{100}
\documentclass[paper=a4,fontsize=11pt,DIV=14,parskip=half-,
               captions=tableabove,twoside=on]{scrartcl}
\usepackage{fontspec}
[...]
```

In this case no extra filename is needed, running `runtexfile runtexfile-doc` is sufficient. More complex is the header of example test2:

### 2.2 Document test

This document uses package `imakeidx` which itself runs the index commands. (Beccari and Gregorio 2016)

## References

### Example test

```
%! HV lualatex --shell-escape  
%! HV biber <test.aux>  
%! HV lualatex --shell-escape  
%! HV lualatex --shell-escape  
  
%% The index files are run by imakeidx  
[...]
```

The filename for biber is not really needed, because it also works with the main filename.

### 2.3 Document test2

A more complex example:

### Example test2

```
%! HV lualatex --shell-escape  
%! HV biber  
%! HV lualatex --shell-escape  
%! HV xindex  
%! HV xindex --config DIN2 -l DE -o test2.vwd <test2.vwx>  
%! HV xindex --config DIN2 -l DE -o test2.dbd <test2.dbx>  
%! HV lualatex --shell-escape  
%! HV lualatex --shell-escape
```

There is an optional argument for lualatex and options with another filename for two of the three xindex runs. (Voß 2025)
